

ComponentOne Doc-To-Help® 6.0

The Essential Help Authoring Tool for Microsoft® Word

ComponentOne Doc-To-Help 6.0

ComponentOne Doc-To-Help 6.0 combines the best of Doc-To-Help 2000 with the best of True Help™ 1.0 to create a new Help authoring tool that's perfect for the novice or expert Help author.

New to Help authoring? If you can use Microsoft Word, you can produce a robust Help system quickly and easily. ComponentOne Doc-To-Help 6.0 is also a great tool for experienced Help authors because it offers the sophisticated extras you look for.

Whether you need to create HTML Help 1.x, cross-platform HTML 4.0, WinHelp 4.0, JavaHelp 1.1, or print documentation, ComponentOne Doc-To-Help makes the process pleasant and efficient. Plus, it's Microsoft Help 2.0 ready!

Best of Both Worlds: Easy to Use and Powerful

We've combined the favorite features from Doc-To-Help 2000 (cross-references, margin notes, and topic types) with the favorites from True Help 1.0 (streamlined build process, scripting, and report generation), while retaining the Microsoft Word-based, single-source authoring of the original tools. Then we added new features and enhancements to ensure it was as powerful as it was easy to use. Take a look at what ComponentOne Doc-To-Help 6.0 offers:

- **Single-source authoring:** Create HTML Help, cross-platform HTML Help, WinHelp, JavaHelp, and print documentation from a single set of Word documents—there's no need to purchase separate editions! Eager to create Microsoft Help 2.0 when it's released by Microsoft? No problem, ComponentOne Doc-To-Help 6.0 is also Microsoft Help 2.0 ready. Porting your Help system to a different platform is as simple as selecting a list item and clicking a button.
- **Styles and templates:** ComponentOne Doc-To-Help 6.0 generates Help systems from the styles you use to format the source documents, so document mark-up is greatly reduced. Plus, you're not limited to using specific document templates or style sets—use your own style conventions or use the templates we include with ComponentOne Doc-To-Help 6.0. And you Doc-To-Help 2000 users will love the fact that you can put text in

Heading 1, which now has the same functionality as any other heading style!

- **Database architecture:** ComponentOne Doc-To-Help 6.0's unique project architecture stores the relationships among styles, topics, index keywords, and table of contents entries in a per-project database, automatically generating index entries, hyperlink tags, jumps and pop-ups, etc. You can also share information among multiple projects!
- **Intuitive user interface and Word toolbar:** ComponentOne Doc-To-Help 6.0 has a redesigned "all in one" interface that puts full functionality at your fingertips, not hidden in a maze of dialogs. We've also included a Word toolbar that allows you to incorporate many Help authoring functions, such as margin notes, dynamic links, and conditional text in your source documents.
- **Project editor:** With the project editor, you can perform a wide range of Help authoring tasks (such as in-place editing and topic filtering and sorting) from within one interface, making editing source documents and setting the properties of Help targets very convenient!
- **Enhanced graphics:** You don't need to scale an image in a graphics package before adding it to your document—simply use the Insert Picture and Format Picture options within Microsoft Word! You can also easily create hot spots with graphics.
- **Flexible conditional text:** Need to provide links to related topics in the online Help, but omit them from your printed manual? These and related scenarios are no problem because ComponentOne Doc-To-Help 6.0 gives you all the benefits of single-source authoring, plus the ability to designate portions of your source documents for individual platforms, Help targets, or attributes (author-defined criteria).
- **Margin notes:** Adding margin notes is as easy as clicking the Insert Margin Note button on the ComponentOne Doc-To-Help 6.0 toolbar and entering the desired text. You can also make those margin notes appear in the online Help as pop-ups by clicking the Link to Margin Note button when the text is entered.

▪ Links, jumps, pop-ups, and more:

ComponentOne Doc-To-Help 6.0 makes it a snap to add topic links and jumps, pop-up topics, dynamic links (A-links and K-links), and cross-references!

- **Glossary terms:** Creating glossaries is easy! An empty glossary is automatically prepared when you create a new project. Simply open the glossary document and enter text as desired. During compilation, project documents are searched for text that matches glossary entries and those matches are converted into hypertext links.

- **Enhanced indexing:** As your source documents are compiled, topic hierarchy information and any existing XE field data are extracted and saved to the project database. You can then easily attach index keywords to topics and simply push a button to rebuild the project and update its index.

- **Scripting:** If you're a programmer, ComponentOne Doc-To-Help 6.0 even allows you to use Visual Basic scripts to customize the behavior of individual styles at compile time!

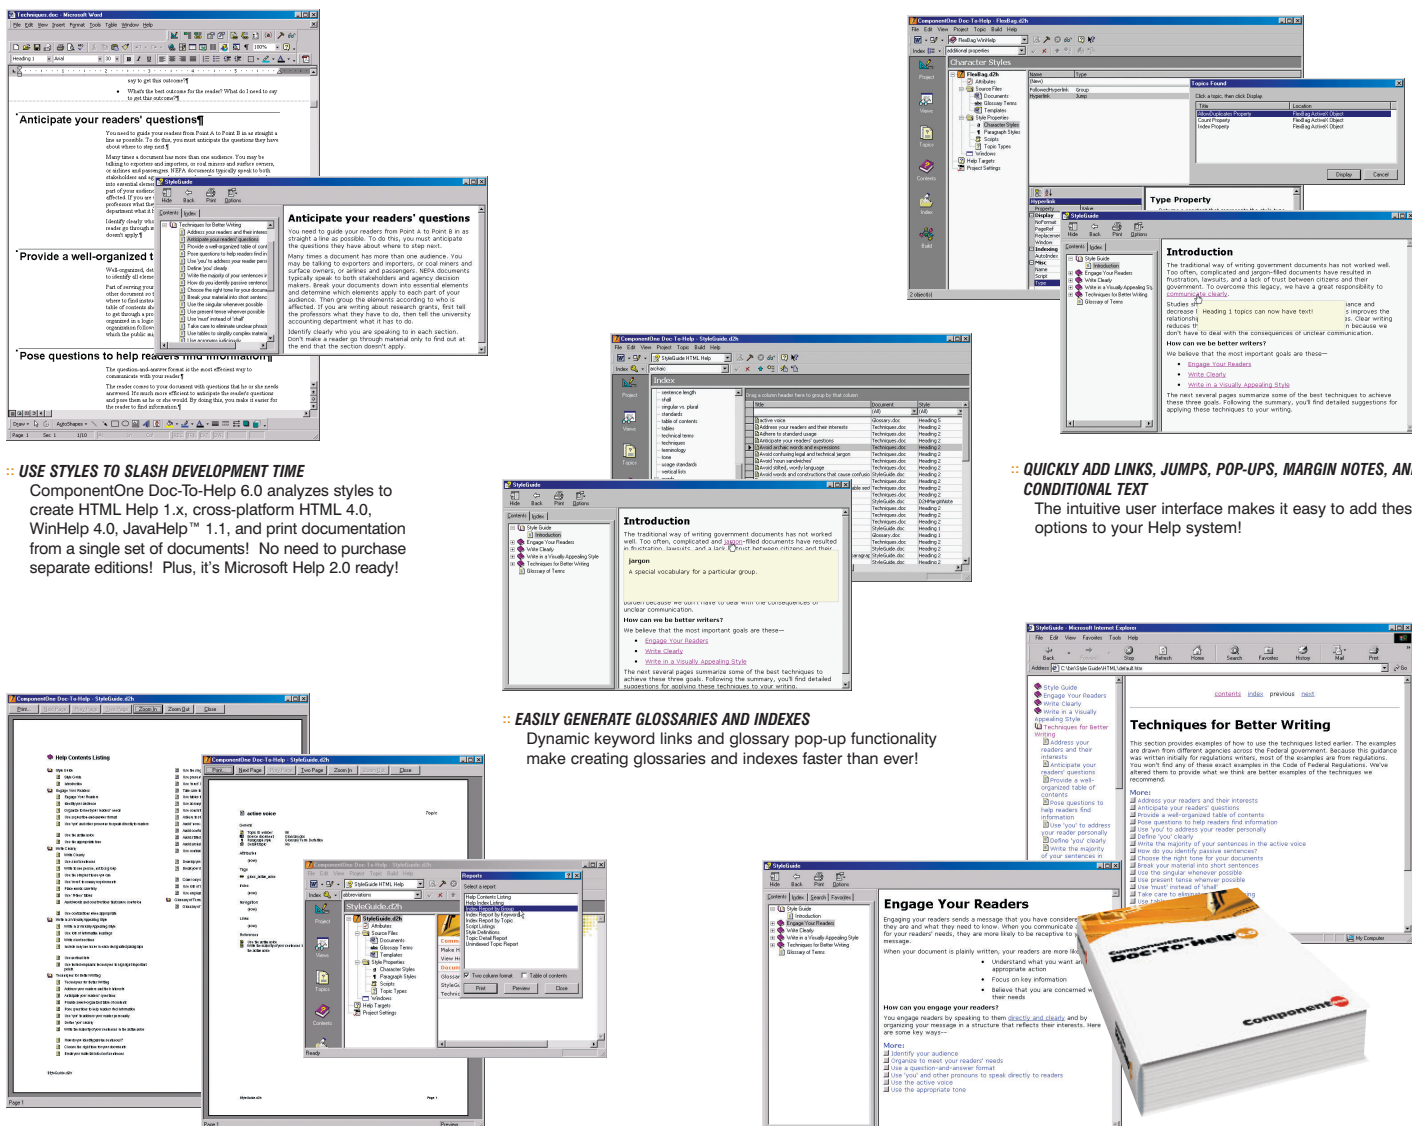

- **Modular help projects:** Unlike multi-file projects, in which several Word document files in the same folder are compiled together into one Help file, modular Help projects consist of documents in different folders that are part of different Help projects, and are compiled into different Help files that appear as one file to users. ComponentOne Doc-To-Help 6.0 makes it easy to retain the same high-quality Windows Help and HTML Help systems as you would with a single project!

- **Conversion utility:** Easily convert your existing Doc-To-Help 2000 projects with the click of a button! True Help 1.0 files are automatically read and do not require conversion to open existing projects.

- **Useful reports:** You can organize your large projects with reports that show contents, index, script, style, and topic information. You can also have hierarchical views of individual projects, such as reports showing topics with keywords and vice versa. All reports are offered in online and hard copy formats.

ComponentOne Doc-To-Help® 6.0

The Essential Help Authoring Tool for Microsoft® Word

USE STYLES TO SLASH DEVELOPMENT TIME

ComponentOne Doc-To-Help 6.0 analyzes styles to create HTML Help 1.x, cross-platform HTML 4.0, WinHelp 4.0, JavaHelp™ 1.1, and print documentation from a single set of documents! No need to purchase separate editions! Plus, it's Microsoft Help 2.0 ready!

QUICKLY ADD LINKS, JUMPS, POP-UPS, MARGIN NOTES, AND CONDITIONAL TEXT

The intuitive user interface makes it easy to add these options to your Help system!

EASILY GENERATE GLOSSARIES AND INDEXES

Dynamic keyword links and glossary pop-up functionality make creating glossaries and indexes faster than ever!
