

Introduction of Computer

Windows Explorer

In windows explorer, you can see both files and folders in each related folder. This is especially useful for coping and moving files. You can open the folder that contains the files you want to move or copy and then drag it to the folder you want to put it in. To find windows explorer, click the START button and then point to programs.

Short Cut Menu

You can use your right mouse button to click any item and see a short cut menu. This menu contains common commands that you can use on the item you clicked. For example, by clicking a file with your right mouse button, you can choose to open, copy or delete it.

Client

Client is a computer or program that requests a service of another computer or program. For instance, if you wish to download a file from a computer using the FTP then your computer will be the client and the remote computer will be the server.

How will distance learning help India?

India is a large country. Many people of India do the part time jobs and study with it by distance learning. So it will help India to educate most of the Indians without joining the regular classes.

Handshaking

Exchange of predetermined signals when a connection is established between two communicational terminals.

Excel

An Excel is a spreadsheet package. A spreadsheet is a software tool that lets one enter, calculate, manipulate and analyze set of numbers. It is a combination of rows and columns. Each intersection of row and column is called a cell. An access stores data in tables, which should be designed before storing data in it. But Excel has pre-created rows and columns. Excel can store only three types of data like numbers, text and formulas.

But another application called Access categorized data in different varieties viz. text, memo, number, Data/Time, currency and Auto number and logical. An Access is an RDBMS that is a collection of inter related information or data.

Relationships among data

The relationship can be well understood from the Entity-Relationship Diagram. The Entity relationship data model is based on a perception of a real world that consists of a set of basic objects called entities and of relationships among those objects.

A relationship is defined as “an association among entities”. A relationship type is an association of entity types, while a relationship instance is an association of entity instances. A relationship may associate an entity with itself. The three types of relationships recognized among various data stored in the database are:

- One-to-one
- One-to-many, or (Many-to-one)
- Many-to-many

One-to-One Relationship

Here each student can only have one roll number. Similarly, each roll number can be assigned to only one student of the same class. For example,

STUDENT → ASSIGNED → ROLL NUMBER

Many-to-One Relationship

One student can register for one course at a time, and a number of students could register for the same course.

STUDENTS → REGISTER → COURSE

Many-to-Many Relationship

A vendor can sell a number of items can many vendors can purchase any particular item.

VENDORS → ITEMS
