Presidents of the Institute

William Barton Rogers, 1862–70, 1879–81

John Daniel Runkle, 1870–78

Francis Amasa Walker, 1881–97

James Mason Crafts, 1897–1900

Henry Smith Pritchett, 1900–07

Richard Cockburn Maclaurin, 1909–20

Ernest Fox Nichols, 1921–22

Samuel Wesley Stratton, 1923–30

Karl Taylor Compton, 1930–48

James Rhyne Killian, Jr., 1948–58

Julius Adams Stratton, 1959–66

Howard Wesley Johnson, 1966–71

Jerome Bert Wiesner, 1971–80

Paul Edward Gray, 1980–90

Charles Marsteller Vest, 1990–

Mission and Origins

The mission of the Massachusetts Institute of Technology is to advance knowledge and educate students in science, technology and other areas of scholarship that will best serve the nation and the world in the 21st century.

The Institute is committed to generating, disseminating and preserving knowledge, and to working with others to bring this knowledge to bear on the world's great challenges. MIT is dedicated to providing its students with an education that combines rigorous academic study and the excitement of discovery with the support and intellectual stimulation of a diverse campus community. It seeks to develop in each member of that community not only the ability to work wisely, creatively and effectively for the betterment of humankind but also the passion for doing so.

The Institute admitted its first students in 1865, four years after the approval of its founding charter. The event marked the culmination of an extended effort by William Barton Rogers, a distinguished natural scientist, to establish a new kind of independent educational institution relevant to an increasingly industrialized America. Rogers stressed the pragmatic and practicable. He believed that professional competence is best fostered by coupling teaching and research and by focusing attention on real-world problems. Toward this end, he pioneered the development of the teaching laboratory.

Today MIT is one of the world's outstanding universities. Education and research—with relevance to the practical world as a guiding principle—continue to be its primary purpose. MIT is independent, coeducational and privately endowed. It is organized into five schools that contain 26 academic departments as well as many interdepartmental programs, laboratories and centers whose work extends beyond traditional departmental boundaries.

The Campus

MIT is located on 153.8 acres that extend more than a mile along the Cambridge side of the Charles River Basin. The central group of inter-connecting buildings, dedicated in 1916, was designed by architect W. Welles Bosworth, Class of 1889, so as to permit easy communication among departments and schools. Many other buildings by some of the world's leading architects—among them Alvar Aalto, Eduardo Catalano, I. M. Pei '40 and Eero Saarinen—have been added since. Sculptures, murals and paintings are found throughout the campus, including works by Alexander Calder, Henry Moore, Louise Nevelson, Pablo Picasso and Frank Stella. Around the halls are exhibits explaining the accomplishments of many of the pioneering people who have studied and taught here.

Administrative Organization of the Institute

The Institute's chief executive officer is the president. The provost, chancellor, executive vice president, and the vice president and secretary of the Corporation report directly to the president. The associate provosts, the deans of the Institute's five schools, and the director of the libraries report to the provost. The dean for undergraduate education and the dean for student life report to the chancellor. The vice president and dean for research reports to the chancellor in his or her capacity as dean, and to the provost in his or her capacity as vice president with oversight of major research laboratories and centers. The dean for graduate students reports jointly to the chancellor and to the vice president and dean for research. The vice presidents, who manage the Institute's major administrative divisions, report to the executive vice president. The treasurer reports to the president and the executive vice president.

The MIT faculty determines the Institute's educational policy. The faculty meets monthly and conducts much of its business through elected standing committees.

The Institute's board of trustees, known as the Corporation, includes approximately 75 distinguished leaders in education, industry, science, engineering and other professions, and (*ex officio*) the MIT chairman, president, treasurer, and secretary of the Corporation, as well as three representatives of the Commonwealth of Massachusetts. The Corporation also includes approximately 20 emeritus members.

The Campaign for MIT

In November 1999, the Institute launched a five-year capital campaign entitled “*Calculated Risks, Creative Revolutions: The Campaign for MIT.*” With a \$1.5 billion goal, the campaign will provide the resources MIT needs to continue its leadership in the new century and to address critical issues facing society at large.

Campaign priorities include:

- Creating or expanding research and educational activities in areas such as neuroscience, the environment, comparative media studies, and entrepreneurship;
- Enhancing MIT’s learning community through teaching innovations, increased research opportunities for students, and extracurricular initiatives; and
- Renewing the physical campus with projects like the Ray and Maria Stata Center for Computer, Information, and Intelligence Sciences; Simmons Hall, a new undergraduate residence; and the Zesiger Sports and Fitness Center.

For more on *The Campaign for MIT*, visit the Giving to MIT Web site at <http://web.mit.edu/campaign>.

Academic Schools, Departments, Divisions and Sections

School of Architecture and Planning

Architecture (Course 4)

Program in Media Arts and Sciences (MAS)

Urban Studies and Planning (Course 11)

School of Engineering

Aeronautics and Astronautics (Course 16)

Chemical Engineering (Course 10)

Civil and Environmental Engineering (Course 1)

Division of Bioengineering and Environmental Health (BEH)

and Technology (HST)

Degrees Awarded

Bachelor of Science (S.B.)
Master of Architecture (M.Arch.)
Master of Business Administration (M.B.A.)
Master in City Planning (M.C.P.)
Master of Engineering (M.Eng.)
Master of Science (S.M.)

Engineer (each degree designating the field in
which it is awarded)

Doctor of Philosophy (Ph.D.)
Doctor of Science (Sc.D.)

Interdisciplinary Laboratories, Centers and Programs

In addition to teaching and conducting research within their departments, MIT faculty, students and staff work in interdisciplinary laboratories and centers. These entities include:

Artificial Intelligence Laboratory
Biomedical Engineering Center
Biotechnology Process Engineering Center
Center for Advanced Educational Services
Center for Advanced Visual Studies
Center for Archaeological Materials
Center for Biomedical Engineering
Center for Cancer Research
Center for Computational Research in Economics
and Management Science
Center for Coordination Science
Center for eBusiness@MIT
Center for Environmental Health Sciences
Center for Environmental Initiatives
Center for Information Systems Research
Center for Innovation in Product Development
Center for International Studies
Center for Learning and Memory
Center for Materials Science and Engineering
Center for Real Estate
Center for Space Research

Women's Studies Program

Lincoln Laboratory

MIT's Lincoln Laboratory, located in Lexington, Mass., is a federally sponsored center for research and development in advanced electronics, with special emphasis on applications to national defense, worldwide communication, and civil air traffic control. Lincoln Laboratory employs 2,120 people and has research revenues of \$361.8 million.

Affiliated Institutions and Programs

MIT maintains a number of cooperative programs with other institutions. Major programs are:

Cambridge-MIT Institute

MIT has launched a major new education and research enterprise with the University of Cambridge in the United Kingdom. Funded by the British government and industry, the Cambridge-MIT Institute concentrates on: undergraduate and faculty exchanges; research that will impact the evolution of technology while increasing our understanding of how to improve productivity, competitiveness and entrepreneurship; adapting MIT's professional degree programs to the United Kingdom; and collaboration with British universities designated as Enterprise Centers.

Charles Stark Draper Laboratory, Inc.

Formerly MIT's Instrumentation Laboratory, Draper Laboratory became an independently operated not-for-profit research and educational organization in 1973. MIT and Draper Laboratory still collaborate in research and teaching in the following areas: guidance, navigation and control; computer science; data and signal processing; materials sciences; integrated circuitry; computational sciences; information systems; mechanical design; and underwater vehicle technologies. More than 60 graduate students are completing their thesis work at Draper. Draper Laboratory also participates in the undergraduate Electrical Engineering and Computer Science VI-A

Program and in the Engineering Internship Program (EIP). Further information is available at www.draper.com.

Dibner Institute for the History of Science and Technology, and Burndy Library

Established at MIT in 1992 as a center for advanced research, the Dibner Institute (DI) supports the work of resident senior scholars, postdoctoral fellows and graduate students in the history and philosophy of science and technology. The DI offers Tuesday lunchtime colloquia, which are open to the public, as well as annual workshops and symposia. Through the MIT Press, it publishes two book series: *Dibner Institute Studies in the History of Science and Technology* and *Burndy Library Publications*. A consortium of MIT, Boston University and Harvard University, the Dibner Institute includes the Burndy Library—a research library with one of the world's finest collections of historical scientific books, manuscripts, instruments and works of art.

Harvard-MIT Division of Health Sciences and Technology

A major collaboration between Harvard University and MIT, the Division integrates engineering, science, technology and medicine for application to the solution of problems in biology and human health. Three hundred thirty students and more than 200 faculty from Harvard and MIT direct the complementary strengths of both universities to the education of physicians, medical engineers and medical physicists, as well as to research on important health and medical problems. Faculty at Harvard teaching hospitals and at research centers associated with both universities

collaborate on a number of the Division's interdisciplinary research programs. Students in the Division may select a program in biomedical sciences leading to an M.D. degree from Harvard Medical School, or may pursue Ph.D. degrees in medical engineering, medical physics, biological engineering, biological physics, or speech and hearing sciences from either MIT or Harvard.

Howard Hughes Medical Institute

The Howard Hughes Medical Institute (HHMI) is a scientific and philanthropic organization that conducts biomedical research in collaboration with universities, academic medical centers, hospitals and other research institutions throughout the country. Twelve HHMI investigators hold faculty appointments at MIT.

MIT-Woods Hole Oceanographic Institution Joint Program in Oceanography and Applied Ocean Science and Engineering

MIT and the Woods Hole Oceanographic Institution jointly offer doctor of science and doctor of philosophy degrees in chemical oceanography, marine geology, marine geophysics, physical oceanography, applied ocean science and engineering, and biological oceanography. They also offer master's programs and professional degrees in some disciplines.

Northeast Radio Observatory Corporation

A consortium of 11 universities and institutions in the northeastern United States, this program promotes radio astronomy research. Its principal facility is MIT's Haystack Observatory in Westford, Mass. The Observatory is also engaged in geodetic research using Very Long Baseline

Interferometry, and in observations of the earth's upper atmosphere using incoherent scatter radar.

Singapore-MIT Alliance

The Singapore-MIT Alliance (SMA) is an innovative engineering education and research collaboration among three premiere academic institutions: the National University of Singapore, Nanyang Technological University and MIT. Founded in November 1998 to promote global engineering education and research, SMA provides students with unlimited access to exceptional faculty expertise and superior research facilities.

Whitehead Institute Center for Genome Research

The Whitehead Institute Center for Genome Research is one of the world's leading genome centers. Achievements include the providing of roughly one-third of the human genome sequence in public databases; the creation of powerful maps of the human and mouse genomes; the development of specialized automation technologies for DNA mapping and sequencing; and the design of informatics strategies that make the Center's data widely available on the Web. The Center is a pioneer in the field of functional genomics, developing novel strategies to trace the origins and improve the diagnosis and treatment of human disease.

Whitehead Institute for Biomedical Research

An independent basic research and teaching institution affiliated with MIT, the Whitehead Institute carries out research in cancer, genomics, infectious disease, developmental and cell biology, structural biology, and molecular medicine.

Faculty members at the Whitehead Institute teach at MIT, and MIT graduate students conduct research and receive training in Whitehead Institute laboratories.

Cross-Registration with Other Schools

Cooperative arrangements enable MIT undergraduate and graduate students to take subjects for credit at Harvard University and Wellesley College without paying additional tuition.

Wellesley operates a free weekday bus service between its campus and the Institute. Further agreements exist between specific departments and programs at MIT and their counterparts at other schools—including Boston University, Brandeis University, Tufts University, the Massachusetts College of Art, and the School of the Museum of Fine Arts. Students taking advantage of these programs may enroll only in specified subjects. During the Summer Session there is no cross-registration with other schools; during IAP (Independent Activities Period), the only cross-registration is with Wellesley College.

Study Abroad / Domestic Study Away

Students can take advantage of Study Abroad or Domestic Study Away and spend one or two terms at another academic institution to pursue studies not available at MIT. Students have used overseas study to complete humanities requirements or to become fluent in a new language. While studying elsewhere, students pay no MIT tuition but maintain official status. A student is expected to return to MIT to complete a degree program. For more information, please see <http://web.mit.edu/career/www/Abroad/study.html>.

Research at MIT

MIT's commitment to joining education with the creation of knowledge provides a fertile setting for research that has spawned a host of scientific breakthroughs and technological advances. Past achievements include the creation of modern food preservation processes, the first chemical synthesis of penicillin and vitamin A, inertial guidance systems, modern technologies for artificial limbs, high-speed photography, and the magnetic core memory that made possible the development of digital computers.

In recent years, research teams at MIT have located the gene defect responsible for myotonic dystrophy—the most common form of muscular dystrophy—and identified the nature of the mutation; fabricated a single-electron transistor; developed a new optical technique to measure galaxy distances with unprecedented accuracy and reliability; and developed a microchip that releases different chemicals on demand from tiny reservoirs built into its structure, a technology that has many potential uses in medicine and other fields.

MIT is one of the leading research universities in the country. In 1999–2000, approximately 2,500 researchers worked with faculty and students on projects funded by government, foundations and industry. MIT employs 2,401 graduate research assistants and 741 teaching assistants. A recent study concluded that Institute inventions add more than \$20 billion and 150,000 jobs to the U.S.

economy each year. MIT routinely leads all U.S. universities in patents granted, and in each of the past five years its Technology Licensing Office has signed 50 to 75 option and license agreements.

Research Sponsorship (in thousands)
Fiscal 2000
Total: \$383,988

Faculty and Staff

MIT faculty instruct undergraduate and graduate students, and engage in research. There are 947 faculty members (professors of all ranks), including 150 women. Of the total body, 109* men and 14** women are members of U.S. minority groups.

The Institute's total teaching staff for 2000–2001 includes:

As of 10/31/00	
Professors	594
Associate Professors	183
Assistant Professors	170
Senior Lecturers, Lecturers and Professors Emeriti	411
Instructors [†]	105
Adjunct Faculty	7
Teaching Assistants and Graduate Instructors	741

*73 Asian Americans, 20 African Americans and 16 Hispanic Americans.

**7 Asian Americans, 5 African Americans and 2 Hispanic Americans.

[†]Includes Technical Instructors.

MIT employs about 8,700 individuals on campus. In addition to faculty, there are research, library and administrative staff, as well as many others who—directly or indirectly—support the teaching and research goals of the Institute.

One hundred eleven faculty and staff, both active and emeritus, belong to the National Academy of Engineering, 105 to the National Academy of Science, 25 to the Institute of Medicine, and 209 to the American Academy of Arts and Sciences.

Forty-seven present and former members of the MIT community have won the Nobel Prize. Nine members of the current faculty and an MIT physician are Nobel laureates: Jerome I. Friedman, co-winner, Physics (1990); Har Gobind Khorana, co-winner, Physiology or Medicine (1968); Franco Modigliani, Economics (1985); Mario J. Molina, co-winner, Chemistry (1995); Paul A. Samuelson, Economics (1970); Phillip A. Sharp, co-winner, Physiology or Medicine (1993); Robert M. Solow, Economics (1987); Samuel C.C. Ting, co-winner, Physics (1976); Susumu Tonegawa, Physiology or Medicine (1987); and Eric S. Chivian, MD, co-winner, Nobel Peace Prize (1985).

Four members of the MIT faculty have been awarded the Kyoto Prize: Noam A. Chomsky (1988), Morris Cohen (1987), Edward N. Lorenz (1991), and Claude E. Shannon (1984). In 1990, Marvin L. Minsky was awarded the Japan Prize.

There are 15 MacArthur Fellows among current MIT faculty and staff: Tim Berners-Lee, Jed Z. Buchwald, Noam A. Chomsky, John H. Harbison, Evelyn Fox Keller, Eric Lander, Harlan Lane, Heather N. Lechtman, David C. Page, Michael J. Piore, Charles F. Sabel, Richard M. Stallman, Alar Toomre, Jack Wisdom and George Zweig.

Twenty-three current, emeritus and past members of the MIT faculty have received the National Medal of Science: Manson Benedict (1975), Vannevar Bush (1963), Morris Cohen (1976), Charles Stark Draper (1964), Mildred S. Dresselhaus (1990), Harold E. Edgerton (1973), Herman Feshbach (1986), Hermann A. Haus (1995), Har Gobind Khorana (1987), Edwin H. Land (1967), Warren K. Lewis (1965), Salvador E. Luria (1991), Alexander Rich (1995), Bruno B. Rossi (1983), Paul A. Samuelson (1996), Claude E. Shannon (1966), Isadore M. Singer (1985), Robert M. Solow (1999), Kenneth N. Stevens (1999), John G. Trump (1983), Robert A. Weinberg (1997), Victor F. Weisskopf (1979) and Norbert Wiener (1963). In 1988, Harold E. Edgerton was also awarded the National Medal of Technology.

Admission to MIT

Admission to MIT is based on academic potential; general personal qualifications; and outstanding interests, activities and achievements. In the year 2000, 10,671 candidates submitted final applications for the freshman class, and 1,726—16 percent—were offered admission. Total first-year enrollment was 1,012; an additional 35 students transferred to MIT from other universities.

Applicants for graduate degree programs are evaluated for prior performance and professional promise by the department in which they wish to register. In 2000, 12,979 candidates applied for graduate study. Of the 3,339 candidates who received offers of admission, 1,580, or 47 percent, registered in advanced degree programs at MIT.

Undergraduate Education

MIT is committed to providing students with a strong scientific, technical and humanist foundation, and to encouraging them to develop creativity in defining problems and seeking solutions. For the bachelor of science degree, students must complete a core requirement that is equally divided between science and mathematics and the humanities, arts and social sciences. The science/mathematics requirement includes chemistry, biology, physics and calculus, as well as laboratory and science electives. The humanities, arts and social sciences requirement must be fulfilled among three of five categories: literary and textual studies; language, thought and value; the arts; cultures and societies; and historical studies. Students must also complete a multi-part writing requirement.

At the same time, students have many opportunities to pursue their own educational goals. The following programs are among students' options for directing their course of study.

The Undergraduate Research Opportunities Program (UROP)

UROP supports undergraduate and faculty collaborations in areas such as: Alzheimer's disease research, tissue engineering, interactive cinema, language acquisition in children, holograms, fluid mechanics, Web-based teaching initiatives, polymer engineering, climate change, and micro-economics. The possibilities are virtually endless.

Students usually join a faculty member's project, but they may also design their own and recruit faculty to advise them. They can earn academic credit or pay, or work as volunteers. The program is open to all MIT and Wellesley undergraduates, who may conduct research in any department. Founded in 1969, UROP has been used as a model for undergraduate research programs in academic institutions around the country. Typically, 80 percent of seniors will have done at least one UROP project during their time at MIT.

Independent Activities Period (IAP)

During IAP, a special four-week period in January, students may pursue their own educational interests and goals. Most students remain on campus during IAP because there are so many things to do. They can participate in more than 600 workshops, independent research projects, intensive subjects and seminars, field trips, lecture series, and other activities that don't easily fit into the traditional academic calendar. Choices range from classes in folk dance, magic, origami and Indian cooking to subjects offering credit—such as motor-making, French, special relativity, and weather forecasting. Many faculty try out innovative educational experiments during this time, and most faculty are available for informal contact with students.

Students may take up to 12 units of credit per IAP and, in fact, some departmental programs may require them to take up to 12 units during one IAP after their freshman year.

Alternative Freshman Programs

Three freshman programs offer alternatives to the traditional lecture/recitation and subject-by-subject method of completing degree requirements.

The Concourse Program

Sponsored by the School of Engineering, the Concourse Program presents physics, calculus, chemistry and the humanities—most of the core freshman subjects—as a unified curriculum. Only 60 students are admitted to the program each year, so class sizes are small and student-faculty interactions are close.

The Experimental Study Group (ESG)

The Experimental Study Group (ESG), sponsored by the School of Science, provides 55 first-year students with a more personalized and interactive approach to learning their core subjects—all within a supportive, interdisciplinary community. Instead of attending large lectures and recitation sections, students choose from a variety of learning methods that allow for plenty of individual attention, including small classes, discussion-oriented seminars, independent study, and tutorials. As much as possible, students are given the flexibility to arrange their schedules to suit their needs and to move through the material at their own pace. Opportunity for educational experimentation is also available, including the development of seminars, labs and independent projects under staff supervision.

The Integrated Studies Program (ISP)

The Integrated Studies Program (ISP), sponsored by the School of Engineering, integrates coursework in the humanities, sciences and engineering, and is distinguished by its emphasis on learning-by-doing. All students enroll in fall and spring humanities courses that explore the relationship between technology and society. The program includes workshops in all of the technologies studied. Students attend core science and math courses with the rest of the freshman class, but may opt to enroll in ISP-sponsored recitations or study groups. Enrollment is limited to 40 freshmen.

Enrollment 2000–2001

Undergraduate Enrollment	4,258
First-Year*	1,017
Undeclared Second-Year*	12
Special Undergraduate Students	5
Architecture and Planning	73
Engineering	1,985
Humanities, Arts, and Social Sciences	135
Management	264
Science	767

*MIT students do not enroll in an academic department until the start of their sophomore year, and may defer decision on a course of study until the end of that year.

Graduate Enrollment	5,832		
	Master	Doctoral	Special
Architecture and Planning	371	179	10
Engineering	1,411	1,157	41
Humanities, Arts, and Social Sciences	24	307	5
Management	797	113	17
Science	27	996	11
Whitaker College	8	284*	6
CAES**			68

*This number includes 179 students working on Harvard degrees only.

**Center for Advanced Educational Services.

Women have attended MIT since 1871. In 2000–2001, there are 1,755 women enrolled as undergraduates (41 percent) and 1,580 as graduate students (27 percent).

United States minority groups are represented by 1,984 undergraduates (47 percent) and 796 graduate students (14 percent):

	Undergraduate	Graduate
African American	268	134
Asian American	1,166	529
Hispanic	471	123
Native American	79	10

In 2000–2001, MIT students come from all 50 states, the District of Columbia, and three territories. The Institute’s international student population comprises 360 undergraduates (8 percent) and 2,129 graduate students (37 percent) from 109 foreign countries.

Tuition and Financial Aid

Undergraduate Tuition and Living Expenses

Nine months' tuition for 2000–2001 is \$26,050. In addition, undergraduate room and board is approximately \$7,175, with actual costs dependent on the student's housing and dining arrangements. Books, materials and personal expenses (including clothes, laundry and recreation, but excluding travel) are about \$2,875.

Undergraduate Financial Aid

The Institute's undergraduate financial aid program ensures that an MIT education is accessible to all qualified candidates regardless of their financial resources. MIT provides financial aid to meet the full cost of an MIT education, based on the calculated needs of the family. Currently, approximately 60 percent of all undergraduates receive some type of financial assistance.

The amount of financial aid for which an undergraduate is eligible is determined by the family's financial situation. Using information provided by the family on the Free Application for Federal Student Aid (FAFSA) form and the College Scholarship Service (CSS) PROFILE form, MIT establishes dollar amounts for the parents' and the student's contributions.

In addition, all aid recipients are expected to meet a portion of their need through a loan, part-time job, or both. This "self-help" component is set annually (\$7,600 for 2000–2001). The balance is

met with grants. This policy assures each student a reasonable loan, and provides an equitable distribution of grant funds. In 2000–2001, the average grant and scholarship awarded to students who were eligible for aid was \$16,215.

Graduate Tuition and Living Expenses

Graduate students generally incur greater expenses than undergraduates. For example, most attend the Institute for a calendar year rather than for an academic year, increasing tuition. In 2000–2001, nine months' tuition is \$26,050 (except in the School of Management, where tuition for the master's degree program is \$29,860). Summer term tuition for 2000 was \$8,685 for students enrolled in courses, but was fully subsidized for students registered for thesis research or for qualified thesis and pre-thesis coursework.

MIT's residential system can currently accommodate about one-third of its graduate students; the rest find housing in the Boston-Cambridge area. Graduate students' costs for housing, food, books, medical insurance and incidentals vary widely, depending on marital status, quality-of-life expectations and housing arrangements. Typical monthly expenses range from \$1,500 to \$2,500. MIT gives newly-admitted graduate students a financial planning guide to help them make more precise estimates.

Graduate Financial Aid

Financial aid for graduate students is in large part provided by individual departments, and the amount of aid available varies significantly among disciplines. Financial support includes fellowships, traineeships, teaching and research assistantships, and loans. Most forms of support are granted for merit, while others are granted for financial need or for a combination of merit and need.

Residential Life

Undergraduate Students

Most undergraduates now live in MIT's 10 Institute houses or in 35 MIT-affiliated fraternities, sororities and independent living groups. Because of the importance of the residential program in students' social and intellectual development, beginning in the fall of 2002 MIT plans to require that all unmarried first-year students live within the Institute's on-campus housing system—except for those who commute from the homes of their parents or close relatives. One guide to the potential success of this program is the extraordinarily large number of students who elect to remain in campus housing after their first year, despite the option to live elsewhere.

The opening of a new undergraduate residence in September 2002 will provide additional living space for about 350 students. This new facility, Simmons Hall, is currently under construction on Vassar Street, north of the athletic fields.

Graduate Students

Approximately 1,060 single graduate students currently reside in MIT's four campus houses—Avery Allen Ashdown House, Ida Flansburgh Green Hall, Ping-Yuan Tang Residence Hall, and the Harold E. Edgerton House. An additional 407 married students and their families live in two campus apartment complexes, Westgate and Eastgate. About 70 graduate students live in undergraduate dorms and act as graduate resident assistants.

New on-campus housing for graduate students is also planned. The 224 Albany Street graduate dormitory, scheduled to open in September 2001, will house approximately 120 students. One year later, the 70 Pacific Street graduate residence is expected to come on-line with living space for about 600 additional graduate students.

Educational Resources

MIT Libraries

This system comprises five large libraries—Engineering; Science; Social Sciences and Management; Architecture and Planning; and Humanities—and five smaller, more specialized collections—Music; Visual Collections; Neurosciences; Aeronautics and Astronautics; and Earth, Atmospheric, and Planetary Sciences. The system contains over 2.5 million volumes and 18,000 serial titles, more than two million microforms, and major collections of photographs, maps, and audio and video recordings. Over 100 databases are available through the MIT network. In addition, hundreds of other electronic resources are accessible to members of the MIT community in the libraries and remotely. The Institute Archives collects MIT records, MIT publications and technical reports, and the personal papers of faculty. Information services are available from library staff in each location, or through the system's Web site:
<http://libraries.mit.edu>.

Computer Resources

MIT's computing environment gives members of the community access to a rich array of technologies and information resources. Many of these resources, including networks and telecommunications, are the responsibility of Information Systems (IS), while several departments and laboratories maintain their own computing facilities. IS services and facilities include MITnet (the campus network), the Athena

Computing Environment, and a variety of support avenues—help lines, consulting, training and publications—to help members of the MIT community make effective use of information technology.

Most of MIT's computers connect to MITnet and to the Internet, providing convenient access to resources such as the World Wide Web. Athena offers resources to students, faculty and staff with courseware, electronic mail, applications such as word processing and graphics software, utilities, programming tools, printers, and a host of computer network services. Many of MIT's academic and administrative functions are being moved to networked and Web-based applications. With these resources, members of the MIT community can share information and programs, communicate with each other, and work together on problems and ideas in creative ways.

Several recent initiatives exemplify MIT's commitment to advancing educational technology. These include:

- The Educational Media Creation Center, designed to support the production of media- and Web-based educational materials;
- I-campus, the MIT-Microsoft alliance to foster large-scale educational experiments; and
- The Stellar Project, a partnership between MIT and the Open Knowledge Initiative that seeks to implement an open-standard, Web-based learning system.

At the infrastructure level, campus facilities and classrooms are being redesigned to support the full spectrum of educational technologies.

The MIT Press

One of the country's largest university presses, the MIT Press publishes professional, reference and scholarly books; graduate and undergraduate texts; and books for general audiences. Its major fields are: computer science and artificial intelligence, cognitive science, neuroscience, economics, architecture and design arts, linguistics, philosophy, and technology and environmental studies. It also publishes 39 journals in these disciplines, and is a leader in the development of electronic community technology—including CogNet and ArchNet. Thirty-five percent of its sales are to export markets. The Press operates its own bookstore in Kendall Square.

The Arts

MIT is committed to the arts as an integral part of its curriculum. The arts are widely practiced, performed and celebrated on campus—in corridors and in classrooms, on stage and in studios.

Over 500 exhibitions, performances and readings enliven our community annually, enhancing and enriching campus life while drawing tens of thousands of visitors to the Institute.

MIT attracts students who apply creative thinking and excellent problem-solving skills to diverse endeavors—from manufacturing to music, from polymer science to poetry. In fact, 60 to 70 percent of incoming freshmen bring with them strong interests and varied experiences in the arts, and over half of MIT's undergraduates enroll in arts courses each year. The Institute offers degrees through the School of Architecture and Planning, and majors and minors in music, theater and writing through the School of Humanities, Arts, and Social Sciences. Many students—including those in other degree programs—pursue their artistic interests by participating in the MIT Symphony Orchestra, Dramashop, or one of nearly 50 other music, theater and dance groups.

MIT students also benefit from the guidance of scholars, practitioners and mentors who possess excellent credentials and an abiding love of art. The Institute is home to distinguished arts faculty such as Pulitzer Prize-winning composer John Harbison (one of eight composers on the

music faculty), novelist Anita Desai, and conceptual artist Krzysztof Wodiczko. In addition, visiting artists from around the world come to the campus for periods ranging from three days to a semester or more, providing insights into different cultures and alternative views on familiar problems.

Productions range from chamber music to electronic “hyperinstrument” concerts, classic Shakespearean plays to improvisational comedy, and ballroom to modern dance. MIT is home to Boston’s only Balinese gamelan* and to New England’s only East African performance ensemble. The Institute is also a leading presenter of South Asian music and dance.

Recognized internationally for its thought-provoking exhibitions of contemporary art, the List Visual Arts Center encompasses a permanent collection of nearly 2,000 pieces sited throughout the Institute. Included is an acclaimed outdoor sculpture collection featuring works by Alexander Calder, Henry Moore, Louise Nevelson and other international figures.

The MIT Museum presents exhibitions and programs that explore the foundations and frontiers of science and technology. The Museum provides a window on the research being done behind laboratory doors, and gives visitors the opportunity to investigate technological innovation.

*an Indonesian orchestra largely composed of percussion instruments

The Institute also hosts the Museum Loan Network—a program funded by the John S. and James L. Knight Foundation and The Pew Charitable Trusts to promote collection sharing among museums nationwide.

For more information, including upcoming event listings, visit <http://web.mit.edu/arts> or call the Office of the Arts at (617) 253-4003.

Athletics and Recreation

The MIT athletic program offers opportunities for sports instruction and participation at all levels. Physical education is required for all undergraduates. Approximately 20 percent of undergraduates also compete in intercollegiate athletics, and more than 65 percent of all students (graduate and undergraduate) take part in intramural sports. According to the National Collegiate Athletic Association (NCAA), MIT sponsors one of the broadest intercollegiate athletic programs in the country, with 41 varsity teams (21 for men, 17 for women, 3 coeducational)—including football and club varsity men's ice hockey. MIT competes mainly against New England colleges and Ivy League schools, but has also participated regionally and nationally in tournaments and championships. There are more than 20 intramural programs, with over 1,000 teams and a 75 percent undergraduate participation rate. Club sports (40 programs) are open to undergraduates, graduate students, faculty and staff.

MIT's athletic facilities are currently undergoing unprecedented expansion and renovation. Construction is already underway on the Zesiger Sports and Fitness Center. This building—which will house two swimming pools, a health-fitness center, squash courts built to international standards, a multiple-activity court and support services—is scheduled for completion in the summer of 2002.

ROTC

MIT has offered military leadership training to its students since it opened its doors in 1865. Today it is one of the few universities in the country that offers ROTC programs in all three main branches of the United States military: Army, Navy/Marine Corps and Air Force. In 2000–2001, eight MIT students participated in the Army ROTC program, 45 students in the Navy/Marine Corps program, and 34 in the Air Force unit.

Students who complete the ROTC program receive their commissions after graduation. If commissioned in the Navy or Air Force, graduates serve a period of active duty. If commissioned in the Army, they serve either a period of active duty, a combination of active duty and reserve forces duty, or strictly reserve forces duty. All three programs also offer some students the opportunity to pursue graduate education before fulfilling any military obligation.

MIT Students After Graduation

Forty-two percent of all students who received bachelor's degrees from MIT in 1999 went directly to graduate school, including 72 entering medical school.

Those MIT graduates choosing careers over advanced study have found themselves in demand across a wide range of industries and occupations. The most sought-after students are those with skills, knowledge and experience in information technology, with particular emphasis on new multi-media and Internet technologies. Management and technical consulting firms and investment banking firms are among the top employers recruiting Institute graduates.

Companies have learned that MIT students in a wide variety of fields have substantial experience with information technology, and thus are interested in degree candidates from all majors and at all levels. The telecommunications, pharmaceutical, finance and semiconductor industries have contributed noticeably to this demand. Responding to these new opportunities, Institute graduates have been pursuing increasingly diverse careers. For example, Ph.D.s are finding their way into management and technical consulting, patent law firms and investment banking, as well as into careers in teaching and research. Also, many MIT students—from all courses of study—are joining start-up companies, especially in e-commerce, information technology and telecommunications.

Starting salaries have increased, as have the number and breadth of firms offering signing bonuses. Salaries for doctoral graduates in engineering reportedly range, on average, from \$70,000 to \$100,000, while offers to master's and bachelor's graduates range from \$60,000 to \$90,000 and \$51,000 to \$80,000, respectively.

Association of Alumni and Alumnae of MIT

The Association of Alumni and Alumnae of MIT provides ways for over 90,000 former students to stay in touch with one another and to continue their MIT connections. Under the direction of a volunteer alumni board, the Association staff helps members engage with the Institute and with one another through events held worldwide, through Web-based services, and through involvement in fundraising for the Institute. The Association also publishes MIT's award-winning magazine, *Technology Review*.

In addition to traditional programs such as regional clubs and reunions, the Association's popular suite of online alumni services, the "Infinite Connection," has enrolled more than 40 percent of the alumni body. Other popular alumni programs include MIT on the Road, Tech Reunions and the Enterprise Forum of MIT.

Nearly 6,000 alumni and alumnae volunteer their services for the Institute each year, with many serving as class and club officers, as educational counselors, and as members of the MIT Corporation and its Visiting Committees.

In fiscal year 2000, the Alumni Fund reported a record \$32.6 million in gifts from 29,619 alumni/ae donors, placing MIT's annual fund in the top ten nationwide.

For more, visit the Association Web site at <http://web.mit.edu/alum>.

MIT and the Community

Since its founding, MIT has maintained a commitment to serving the Commonwealth of Massachusetts and its cities and towns as a resource for education and technology, and as a good neighbor. MIT owns property in eight Massachusetts communities, paying taxes on its commercial property and offering payments in lieu of taxes for property that is legally tax-exempt. In the year 2000, these payments totaled over \$8 million. The Institute also dedicates resources and expertise to civic initiatives—for example, \$3 million to defray the cost of improvements in the storm water infrastructure of the City of Cambridge, and participation in a consortium to help achieve a clean Charles River by the year 2005.

MIT contributes significantly to the state and local economy. A 1997 BankBoston study revealed that 1,065 MIT-related companies are headquartered in Massachusetts—employing 125,000 people and representing 10 percent of the state's economic base. In Cambridge alone, 150 MIT-related companies have generated at least 14,000 jobs and more than \$700 million in sales within the Commonwealth. MIT's "Cambridge First Purchasing Program," along with its taxes paid, payments in lieu of taxes, and municipal fees, brought the economic contribution to the City of Cambridge to more than \$44 million last year.

Faculty, staff and students at MIT are involved in a broad range of volunteer activities in Cambridge, with the Institute supporting over 80 educational programs and more than 100 community initiatives annually. These include: City Days, where MIT students and Cambridge public school students interact in a variety of learning activities; the Elementary School Science Fair, which MIT hosts for Cambridge school-children; and Key Pals, which pairs middle school students with MIT staff for e-mail exchanges and visits to campus. The MIT Community Service Fund makes financial grants to organizations in Cambridge where MIT volunteers dedicate their talent, time and efforts. The Institute also sponsors many community events, such as museum exhibits, lectures and concerts.

For more information about MIT and the community, please contact the Office of Government and Community Relations at (617) 253-1988.

MIT and Industry

MIT and industry have a long record of cooperation, with projects ranging from joint education and research (where student participation is often a strong component) to intensive continuing education programs. The collaboration is extensive: Industrial executives serve on the MIT Corporation and its committees; MIT faculty serve as consultants for industry; and MIT educates and prepares its students for careers in industry. The relationship between MIT and industry has had an important effect on the direction of education at the Institute.

Office of Corporate Relations and Industrial Liaison Program

The Office of Corporate Relations at MIT promotes collaboration among MIT, industry and government in order to better serve the Institute's mission of education, research and service. Its Industrial Liaison Program enables member firms to draw upon MIT expertise to inform their own technology strategies, and at the same time helps Institute faculty stay abreast of the latest developments in industry.

The Industrial Performance Center

The Industrial Performance Center supports research and education aimed at understanding and improving industrial productivity, innovation and competitiveness—both nationally and internationally. About 30 faculty members and more than 50 students from all five MIT schools participate in its programs. Since its founding in 1992,

the Center has conducted research at more than 800 firms in major manufacturing and service industries in the United States, Europe and Asia.

Leaders for Manufacturing Program

Offered jointly by the School of Management and the School of Engineering, Leaders for Manufacturing (LFM) is a unique educational and research program conducted in partnership with more than 20 leading manufacturing companies. Its goals are: to discover and codify guiding principles for manufacturing; to educate new leaders for manufacturing companies; and to disseminate important principles and technologies into global manufacturing practice. LFM's 24-month integrative educational program leads to two master of science degrees—one in engineering and the other in management. An MBA is available alternatively for the management degree. Students learn from faculty at both schools and take part in activities that include 6.5-month internships at partner companies.

Management of Technology Program

Offered within the Sloan School of Management, this was the world's first master's degree program in the management of technology and innovation. The one-year curriculum serves technical managers who seek to create linkages between technology and strategy for their organizations. Participants are selected from manufacturing, service and government organizations worldwide.

MIT Sloan Fellows Program

Offered by MIT's Sloan School of Management, this pioneering 12-month program for mid-career managers prepares outstanding leaders for the increased responsibility of general management and executive positions. Approximately 55 men and women are selected each year from industry, government and other institutions in the United States and abroad. The rigorous specially-designed core curriculum, combined with electives and close contact with international business and government leaders, leads to the MBA degree.

System Design and Management Program

The System Design and Management Program (SDM) is MIT's first degree-granting program offered primarily at a distance. SDM enrolls high-potential mid-career engineering professionals from several of the nation's leading organizations, and draws on faculty expertise in a wide range of fields. The program's goal is to educate future technical leaders in the design and engineering of complex products and systems, preparing them for careers as technically-grounded senior managers. Offered jointly by the School of Engineering and the Sloan School of Management, SDM offers students two options for completing a master of science degree in engineering and management—a 13-month on-campus option, or a 24-month hybrid on-campus/off-campus option that makes heavy use of video conferencing and Web-based instruction linked to work sites around the country.

International Collaborations

MIT is committed to maintaining strong relationships with educational and research institutions, business and industry around the world. MIT faculty and staff travel widely; in addition, in 1999–2000, 1,464 graduate scholars came to MIT from 81 foreign countries to conduct research and to teach in fields as diverse as linguistics, cancer research, chemical engineering and visual arts.

In fiscal year 2000, five percent of sponsored campus research came from abroad (data based on research expenditures from all sources), and about 24 percent of all industrial funding was from foreign industry. Of the corporate membership of the Industrial Liaison Program, 54 percent were based outside the United States.

MIT's international programs include:

Alliance for Global Sustainability

The Alliance for Global Sustainability (AGS)—a research and educational partnership established by MIT, the Swiss Federal Institutes of Technology, and the University of Tokyo—brings scientists, engineers and social scientists together to address the emerging set of complex global environmental issues that profoundly affect social and economic progress. The AGS has built a multidisciplinary, international academic forum in partnership with colleagues from governments, industry and other public and private institutions worldwide. Through its research and education initiatives, the AGS advances knowledge and

understanding of complex problems, and develops intelligent alternative policies and practices that are urgently needed to solve them. AGS research initiatives focus on six sectors that reflect strengths of AGS partners: energy, mobility, water, urban systems, cleaner technologies, and climate change.

MIT International Science and Technology Initiatives (MISTI)

The MIT International Science and Technology Initiatives (MISTI) program has three goals: to increase students' opportunities for international learning by creating new resources on campus and by offering internships in foreign companies and laboratories; to support faculty collaborations with researchers abroad; and to work with corporations, governments and not-for-profit organizations in learning how to internationalize industry, education and research.

MISTI operates through various regional programs. MIT Japan was established in 1981 to promote closer ties among scientists, engineers and industrial managers in the United States and Japan. Now in its twentieth year, the program is the largest center of applied Japanese studies for scientists and engineers in the country. MIT China was launched in 1995, and MIT Germany the following year. In 1999, MISTI established new programs in India and Italy, and in 2000 a new MIT France program was launched.

About 150 students participate every year in MISTI's internship programs. Integrated course offerings in foreign languages and cultures prepare these students for their stay abroad. Conferences, workshops and talks organized by MISTI create a forum for international learning and research at MIT. In addition, MISTI provides in-house training for corporations on subjects of interest.

World Wide Web Consortium (W3C)

The World Wide Web Consortium (W3C) was created to develop common protocols that enhance the interoperability—and promote the evolution—of the World Wide Web. It is an industry consortium jointly run by the MIT Laboratory for Computer Science (LCS) in the United States, the National Institute for Research in Computer Science and Control (INRIA) in France, and Keio University in Japan.

Services provided by the Consortium include: a repository of information about the World Wide Web for developers and users; reference code implementations to embody and promote standards; and various prototype and sample applications to demonstrate the uses of new technology. To date, over 500 organizations are members of the Consortium. The W3C is led by Director Tim Berners-Lee, inventor of the World Wide Web, and Chairman Jean-François Abramatic. Additional information about the World Wide Web Consortium can be found at <http://www.w3.org>.
