

iOS6 Development for Beginners

Lab Exercise 10

1) Follow the steps demonstrated in the video lecture to set up a new iOS 6 application using Xcode 4. Use the following settings when prompted:

2) Create a user interface using the image below as a guide. Note: The custom play, pause, and stop buttons have to be added to supporting files and the control at the bottom of the screen is a Table View control set to Static Cell content with one section.

- * Single View Application
- * Product Name: MP3Player
- * Organization Name: As You Desire
- * Company Identifier: As Appropriate
- * Devices: iPhone
- * Use Storyboard: Checked
- * Use Automatic Reference Counting: Checked

3) Place your favorite MP3s in the Supporting Files folder as well as album covers to go with each song. Note: If album covers are unavailable, you can use some of your favorite images instead.

4) Write the necessary code to display the names of the songs you placed in the Support Files folder in the table.

5) Write the necessary code so that when the user selects a song from the table and presses the play button, that song is played by the application and the corresponding album cover is displayed along with it.

6) Test and debug at this point. Once you have the

play button working and the image correctly displaying, add the necessary code to make the pause and stop buttons functional. Again, test and debug if necessary.

7) Wire up the slider so it allows the user to control the volume of the music playing. Again, test and debug if necessary.

8) Load the application into the simulator. Now sit back, relax, and enjoy your favorite song!
