

iOS6 Development for Beginners

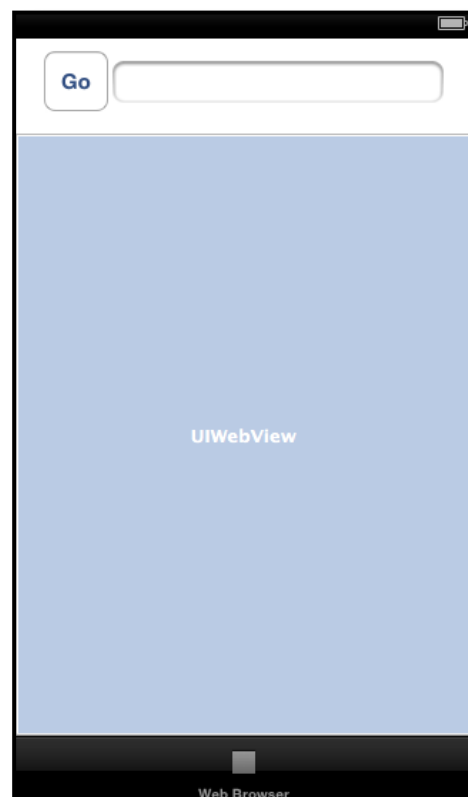

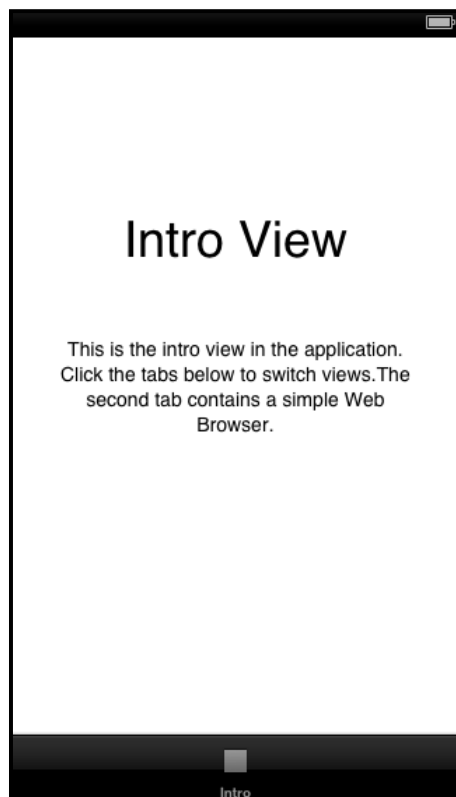

Lab Exercise 11

1) Some steps in this lab exercise require Xcode 5 and iOS 7 to complete. Follow the steps demonstrated in the video lecture to set up a new iOS 6 application using Xcode 4. When prompted, use the following settings:

2) Create a user interface using the images below as a guide.

Note: A tab bar controller must be embedded into the first viewcontroller, then a second must be added and header and implementation files must be made for it.

- * Single View Application
- * Product Name: iOS6To7Conversion
- * Organization Name: As You Desire
- * Company Identifier: As Appropriate
- * Devices: iPhone
- * Use Storyboard: Checked
- * Use Automatic Reference Counting: Checked

3) Attach the components in the second view to the header and implementation files that you created in the previous step.

4) Write the necessary code to build a simple web browser so that when the user types in the textfield and presses go, the webpage is loaded in the UIWebView. Make sure the keyboard resigns when the user presses the return key.

5) At this point, test and debug as necessary. Once you verify everything works correctly, you can move on to subsequent steps.

6) Make sure all of the elements in your project are saved, then close the project in Xcode 4 and open it using Xcode 5. Note: If you get the message that your project is open in another workspace and cannot be opened, quit Xcode 4 and 5, then re-open Xcode 5.

7) When your project loads in Xcode 5, this message should appear:

Select the 'Upgrade' option.

8) All of the view elements should upgrade to the iOS 7 style. Run the application and verify the view elements all work properly.

9) Stop the application after verification and navigate to the application's AppDelegate implementation file.

10) Follow the steps in previous videos to load resources conditionally based on the versions of iOS the application is open in. Set the `tintColor` of the window to green for iOS 7.

11) Run the application one last time and notice the tabbed item descriptor in the tab bar is now green when selected.
