

iOS6 Development for Beginners

Lab Exercise 2

1) Follow the steps demonstrated in the video lecture to set up a new iOS 6 application in xCode 4. Use the following settings when prompted:

2) Using the diagram below as a guide, create a user interface that includes five text fields, necessary labels, and a button. Be sure to position the elements as illustrated and turn off

auto-layout for the application, as well as enable upside down portrait rotation on the summary screen.

- * Single View Application
- * Product Name: RotationLab
- * Organization Name: As You Desire
- * Company Identifier: As Appropriate
- * Devices: iPhone
- * Use Storyboard: Checked
- * Use Automatic Reference Counting: Checked

3) Create the necessary outlets and actions so that when the user presses the “Log Information” button, the information entered in the text fields appears in the Log in Xcode. You will, of course, also need to implement your delegate function to do the work! All of the text field’s text should fit appropriately in a single formatted string in the Log.

4) Add additional actions and code as demonstrated in the video lecture so that the on-screen keyboard disappears when the user presses enter on any of the five text boxes.

5) Test your application and rotate it in the simulator.

Change the code so that all four orientations are allowed by your view controller.

6) Move to the storyboard and, using the techniques demonstrated in lecture, optimize the view so that it appears pleasing and usable in any orientation.

7) Test your application one final time and make sure that it is functional and looks correct in all orientations.
