

iOS6 Development for Beginners

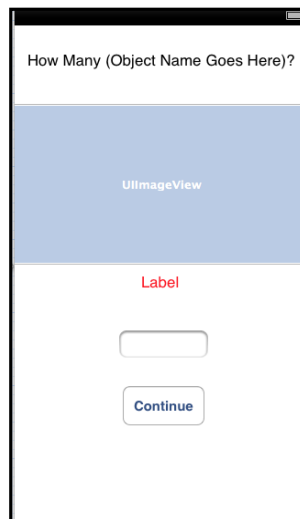

Lab Exercise 3

1) Follow the steps demonstrated in the video lecture to set up a new iOS 6 application in Xcode 4. Use the following settings when prompted:

2) Move the images included with this lab exercise in to the Supporting Files folder inside your project. You may just drag them into the folder within Xcode.

3) Create a layout similar to the illustration

Note: You will have to change the label's text color to red and the imageView's image to one of the four images added to the supporting files in the attributes inspector for each of the elements. Also set the view mode to center for each image.

- * Single View Application
- * Product Name: ObjectFinderLab
- * Organization Name: As You Desire
- * Company Identifier: As Appropriate
- * Devices: iPhone
- * Use Storyboard: Checked
- * Use Automatic Reference Counting: Checked

4) Add two additional View Controllers to the Storyboard. Using the additional images, create layouts similar to the layout above, using each image once.

5) For each view controller create a corresponding View Controller header file and View Controller Implementation file. Create a naming convention so that you can easily tell which view controller belongs to which set of files. Make the necessary changes in the properties of each view controllers in storyboard to associate the correct view controller files.

6) Using the Assistant Editor view, make connections between the ViewControllers in the storyboard and their corresponding header class files.

7) Create segues between the view controllers that are triggered when the continue button is clicked. If the continue button is clicked on the last view controller, segue back to the first.

8) Write code to not let the user continue unless the answer is right. If the answer is wrong set the text of the lower label to 'Wrong answer, guess again'. Allow the segue to take place when the correct answer is entered.

9) Add Code to resign the keyboard when the user presses the return key. Also, if your layout shifts unexpectedly, turn off autolayout . Set the textfields ' keyboard to be numbers and punctuation by default.

10) Test your application using the iOS simulator. Debug if necessary.
