

iOS6 Development for Beginners

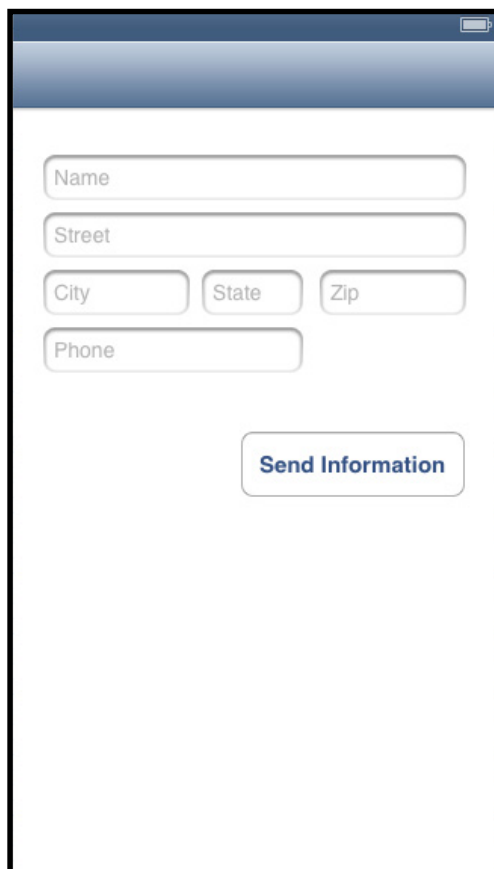

Lab Exercise 5

1) Follow the steps demonstrated in the video lecture to set up a new iOS 6 application. Use the following settings when prompted:

2) Move to the application storyboard and turn off autolayout. As demonstrated in the video lecture, embed a navigation controller in your view controller. Drag a second view controller onto the storyboard. Create a UIViewController subclass header and implementation for the second view controller.

3) As demonstrated in the video lecture, associate the files you just created with the second view controller.

* Single View Application
* Product Name: SendInformation
* Organization Name: As You Desire
* Company Identifier: As Appropriate
* Devices: iPhone
* Use Storyboard: Checked
* Use Automatic Reference Counting: Checked

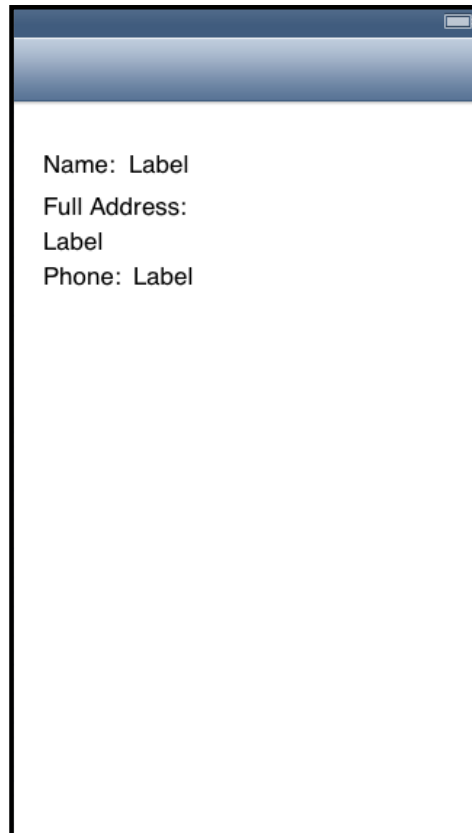

4) Design your first view controller so it looks similar to the illustration to the left.

Note that placeholder text is used inside the textfields to indicate what type of data the user should enter.

5) Create the necessary outlets and actions in the application. Create actions for the textfields to close the keyboard when the return key is pressed.

6) On the second view controller Labels matching the image below:

Write the code so that when the “Send Information” button is clicked on the first view controller, the second view controller appears with the user’s name, address, and phone in separate labels.

7) Test and debug as necessary.
