

iOS6 Development for Beginners

Lab Exercise 7

1) Follow the steps demonstrated in the video lecture to set up a new iOS application. Use the following settings when prompted:

2) Using the image below as a guide, create a user interface that allows the user to enter their name, phone number, and address.

Note: The keyboard should close when the user presses return.

The screenshot shows a mobile application window with a black title bar. The title 'Save Entry' is centered at the top. Below the title, there are four text input fields stacked vertically, each with a light gray border and a small blue cursor. The labels 'Last Name', 'First Name', 'Phone Number', and 'Address' are positioned to the left of each field. At the bottom of the window, there are two buttons. The first button is labeled 'Save Entry' and the second button is labeled 'Go to Load Entry'. Both buttons have a light blue background and a thin blue border.

- * Single View Application
- * Product Name: AddressBook
- * Organization Name: As You Desire
- * Company Identifier: As Appropriate
- * Devices: iPhone
- * Use Storyboard: Checked
- * Use Automatic Reference Counting: Checked

Create a second ViewController, modeling the one below, which allows the user to load a saved record that was saved on the previous view.

The screenshot shows a mobile application interface with a white background and a black title bar. The title bar contains the text "Load Entry" in white. Below the title bar is a text input field with the placeholder text "Last Name". Below the input field is a button labeled "Load Entry". Below the button is a multi-line label with the text "Label". At the bottom of the screen is a button labeled "Go to Save Entry".

3) Complete all necessary storyboard set up and write code so that the information entered into the form at the top of the screen is saved when the button is clicked. Save the information as a text file that includes all the information that the user entered. The filename should be the last name entered by the user appended with the extension .dat.

4) Code the load record button on the second ViewController so that it uses the last name entered in the field above to find the correct file and display the associated information for that person in the multi-lined label below. Code so that errors such as *file not found* are dealt with gracefully by the application.

5) Debug and test your application. Make sure to test thoroughly by attempting to introduce errors into the load or save procedure.
