

iOS6 Development for Beginners

Lab Exercise 9

1) Follow the steps demonstrated in the video lecture to set up a new iOS 6 application using Xcode 4. When prompted, use the following settings:

2) Using the diagram below as a guide, create a user interface. For the custom buttons, download and unzip the zip folder of images. Be sure to position the elements as illustrated and turn off auto-layout for the application.

3) Create the necessary outlets and actions so that when the user presses the search button, the web address entered in the text field loads in the UIWebView. Remember to append the `http://` to the front of the URL in the code so the user does not have to enter it.

4) Add additional actions and code as demonstrated in the video lecture so that the on-screen keyboard disappears when the user presses enter on the text box.

5) Test and debug the search button at this point.

6) Next wire up and code the stop, backward, and forward buttons to do the appropriate actions on the UIWebView.

7) Test your application one final time to make sure it is functional and looks correct.

* Single View Application
* Product Name: WebBrowserApplication
* Organization Name: As You Desire
* Company Identifier: As Appropriate
* Devices: iPhone
* Use Storyboard: Checked
* Use Automatic Reference Counting: Checked
